

# 18.3 and 18.4: Path-independent Integrals and Green's Theorem

## Calculus III

College of the Atlantic

1. Consider the vector field  $\vec{F} = 2x\hat{i} + 2y\hat{j}$ .

(a) Evaluate the integral:

$$\int_{C_1} \vec{F} \cdot d\vec{r}, \quad (1)$$

where  $C_1$  begins at  $(0, 0)$  and ends at  $(2, 3)$ .

(b) Now find a scalar function  $f$  such that  $\vec{\nabla}f = \vec{F}$ . Use  $f$  to evaluate the integral in Eq. (1).

(c) Evaluate

$$\oint_{C_2} \vec{F} \cdot d\vec{r}, \quad (2)$$

where  $C_2$  is a clockwise circle of radius 14 centered at  $1, 2$ .

2. Consider the vector field  $\vec{F} = 2xy\hat{i} + xy\hat{j}$ . Find a scalar  $f$  such that  $\vec{\nabla}f = \vec{F}$ . Use  $f$  to evaluate

$$\int_{C_1} \vec{F} \cdot d\vec{r}, \quad (3)$$

where  $C_1$  begins at  $(0, 0)$  and ends at  $(2, 2)$ .

3. Which of the following are gradient vector fields?

$$\vec{F} = 7\hat{i} - 4\hat{j} \quad (4)$$

$$\vec{F} = 7\hat{i} - 4x\hat{j} \quad (5)$$

$$\vec{F} = 7\hat{i} - 4y\hat{j} \quad (6)$$

$$\vec{F} = x\hat{i} - y\hat{j} \quad (7)$$

$$\vec{F} = x^3\hat{i} + \frac{1}{y}\hat{j} \quad (8)$$

$$\vec{F} = x \cos(y)\hat{i} - \frac{1}{2}x^2 \sin(y)\hat{j} \quad (9)$$
